

Product Details Portal.:

Writeup:

To start, launch Eclipse and create a servlet and class. Also, create a JSP form to collect product details.

- In the servlet, write the code that handles the product details. It's essential to establish a connection between the JSP and servlet by including relevant statements.
- Once the connection between the JSP and servlet is established, you can verify the output. Test the application to ensure that the product details entered in the JSP form are processed correctly by the servlet.
- Finally, conclude the process. This may involve further refining the code, conducting thorough testing, and making any necessary adjustments before considering the development phase complete
