The provided Java code encapsulates a straightforward yet functional expense management application known as "TheDesk." Upon execution, the program greets the user with a warm welcome and presents a menu of operations for managing expenditures. The user can review saved expenses, add new entries, delete existing records, sort expenses in ascending order, search for specific expenditures, and gracefully close the application. The code employs a modular structure, with distinct methods handling each operation to enhance readability and maintainability. Noteworthy is the implementation of sorting and searching functionalities, utilizing the `Collections.sort` method for ordering expenses and a user-friendly search mechanism. Despite its simplicity, the code demonstrates good programming practices and serves as a foundation for a practical expense management tool.
